

1. Write the DDL to create the Parks table. After you have created the table, load the data provided in the attachment (99 - Parks_Data.sql).
2. After loading the data to the table write the SQL using ALTER statements to create:
 - a. The appropriate primary key
 - b. A check statement to check that the country column contains one of these values: AU, CA, JP, MX, PR, UK, US
 - c. The Constraints must have a name included when you add the constraint. The constraint name must be different than the column the constraint is on. An example would be naming the primary key constraint Parks_PK
